TOMATO HOOKS FOR HIGH WIRE GROWING IN GREENHOUSES

Hooks are designed for modern tomato growing in a greenhouse in prolonged cultivation of tomatoes. The shape of our hooks has been appropriately designed to guarantee the necessary mechanical strength needed to bear weight of the plant during the growing season.

Free-fall

The hooks are wound on specially designed winders, with the possibility of separating free bundles in 3 systems:

- with a double bundle separated on a **flexible elastic band**
- with a double bundle so-called retractable bundle (**Zero-Hook**)
- with a **single bundle**

Wire

The wire used is a **special-purpose wire of the highest quality**. Its structure, chemical composition, mechanical strength and a special polished zinc coating ensure effective protection against corrosion.

- Our hooks are durable, do not deform, and their smooth anti-corrosive coating does not lead to damage, thanks to which MyTomatoHooks do not corrode or damage the rope during the growing

Shape of the hook

The shape of our hooks has been appropriately designed with the use of advanced CAD software to guarantee the necessary mechanical strength needed to bear the weight of the plant during the growing season.

Dimensions

4 sizes available: 14cm, 18cm, 22cm, 24cm

Hanging twine

We use **polypropylene twine** in 4 colours: white, blue, yellow, green from renowned European suppliers with such a parameters:

- 1000 m/kg
- 1100 m/kg
- 1200 m/kg

As also **ecological (biodegradable) twine** from EU producers according to wishes of our clients.

Packaging

We use cardboard boxes with adequate strength, and each cardboard box has an individual label with information about the content, order, etc.

Many years of experience allowed us to develop a packaging method so that the hooks never tangle, and their use was quick and easy.

Packaging

with Bio-twine
winded with elastic band

with retractable bundle (Zero-Hook)

with flexible elastic band
